`exercise.sty` : a package to typeset exercises

Paul Pichaureau
paul.pichaureau@alcandre.net

October 21, 2014

Abstract

This package offers a simple environment to typeset exercises, and their questions, sub-questions, indications, answers and so on.

The layout of the exercises is fully customisable. Moreover, the answers of the exercise could be typeset immediately or later in the document.

Contents

1 Options of the package

Here we list the options of the package `exercise.sty`:

`noexercise` hide all the exercises of a document.

`noanswer` hide all the answers of a document. The default behaviour is to show both the exercises and the answers.

`exerciseonly` is a synonym of `noanswer`.

`answeronly` is a synonym of `noexercise`.

`nothing` hide answers and exercises (synonym of `noanswer` and `noexercise`).

`answerdelayed` save the answers instead of typeset them. The answers can be included later in the document with the command `\shipoutAnswer`.

More precisely, the answers are stored in a vertical box. When `\shipoutAnswer` is encountered, this box is emptied and its contents is placed in the main vertical list. The answers defined later are placed in this emptied vertical box. In this way, you can have many group of answers in the same document.

`exercisedelayed` saves the exercises instead of typeset them. The exercises can be included later with the command `\shipoutExercise`.

`lastexercise` if no references is given for an answer, then the answer is supposed to refer to the last exercise (see section 2.1).

2 Commands

2.1 Exercises and answers

`\begin{Exercise}` [⟨*key val list*⟩] ... `\end{Exercise}`
`\begin{Exercise*}` [⟨*key val list*⟩] ... `\end{Exercise*}`

`Exercise` `Exercise*`

The `Exercise` environment is used to typeset just one exercise. We use the keyval package to give different informations about an exercise.

The `Exercise*` environment typeset an exercise without number, and without puting it in the `listofexercices`.

`label`={⟨*string*⟩}
`title`={⟨*string*⟩}
`difficulty`={⟨*number*⟩}
`origin`={⟨*string*⟩}
`name`={⟨*string*⟩}
`counter`={⟨*counter*⟩}
`number`={⟨*string*⟩} `exam`={⟨*string*⟩} `year`={⟨*string*⟩}

All these keys define commands that will be available later to typeset the exercise. They are all optional.

`label` The label of the exercise. This label can be used later in cross-reference, or to link an answer to this exercise.

`title` The title of the exercise. It will be available later with the command `\ExerciseTitle`.

`difficulty` The difficulty of the exercise (a number). It will be available later with the counter `\ExerciseDifficulty`.

`origin` The origin of the exercise. It will be available later with the command `\ExerciseOrigin`.

`name` In document, exercises can have multiple denomination, like problem, exam, or even question. This key allows to change the denomination. This denomination is accessible with the command `\ExerciseName`.

`counter` Use the given counter to number this exercise. Here, {⟨*counter*⟩} must be a pre-defined counter.

`number` Use the given number for the exercise. In fact, this number is a string, so you can number the exercise with letters.

`exam` To keep track of exams associated with the exercise.

`year` To keep track of the year you have given the exercise.

[1]

As an example, with the default definitions, the following code:

```
\begin{Exercise}[title={Euler's constant}, difficulty=2, label=ex1,
                 origin={P.Paelw}]
\end{Exercise}
```

will give

**** Exercise 1 Euler's constant** (*P.Paelw*)

`Problem` It is possible to define different type of exercise. For example, you can define

a `Problem` environment with the two lines:

```
\newcounter{Problem}
\newenvironment{Problem}{\begin{Exercise}[name={Problem},
                                          counter={Problem}]}
                        {\end{Exercise}}
```

Anyway, all type of exercise will have the same layout in the document.

`\begin{Answer}` [⟨*key val list*⟩] ... `\end{Answer}`

`Answer` The `Answer` environment is used to typeset the answer of an exercise. To determine to which exercise this answer is attributed to, you can use the two following keys.

`ref`=`{`⟨*string*⟩`}`
`number`=`{`⟨*string*⟩`}`

`ref` a LaTeX reference. *Must* correspond to the `label` key of an exercise.

`number` if the answer refers to an exercise in another document, you can set the number of the exercise with this key. It is in fact a string.

If the package is loaded with the option `lastexercise` and if no `ref` and no `number` key is given, then the last exercise is taken as a reference for the answer.

If no `ref` and no `number` key is given and the option `lastexercise` is not activated, a Package Warning is displayed.

```
\begin{ExerciseList}
  \Exercise[⟨key val list⟩]
  \Answer[⟨key val list⟩]
\end{ExerciseList}
```

`ExerciseList` The `ExerciseList` environment is a convenience to typeset a list of small exercises. In `ExerciseList`, everything between two `\Exercise` or `\Answer` tags is interpreted as the body of an exercise (or an answer).

`\Exercise` `\Exercise*` `\Answer` The command `\Exercise` inside `ExerciseList` accepts the same keys than the `Exercise` environment. The command `\Answer` inside `ExerciseList` accepts the same keys than the `Answer` environment and behaves in the same way.

2.2 Parts and questions

```
\ExePart[⟨key val list⟩]
\ExePart*[⟨key val list⟩]
```

`\ExePart` `\ExePart*` It is common to split large exercise in parts: it is the purpose of the `\ExePart` command. The keys `title`, `name` and `difficulty` are available for this command.

For example, a non-numbered preliminary part is obtained with

```
\ExePart*[name={Preliminary}]
```

`\Question[`⟨*key val list*⟩`]`
`\subQuestion[`⟨*key val list*⟩`]`
`\subsubQuestion[`⟨*key val list*⟩`]`

`\Question` `\subQuestion` `\subsubQuestion`

These three commands define the hierarchy of questions. A `\subsubQuestion` cannot be preceded by a `\Question` or a `\begin{Exercise}`. A `\subQuestion` cannot be preceded by a `\begin{Exercise}`. If one of these cases is detected, a Package Error is displayed.

Two keys are available for these commands: `title` and `difficulty`.

`\ExeText`

`\ExeText`

The text following this command has the same status that the first indications of the exercise. So, the next level of the hierarchy must be a `\ExePart` or a `\Question`.

2.3 Exercise selection

`\ExerciseSelect[`⟨*key val list*⟩`]`
`\ExerciseSelect*[`⟨*key val list*⟩`]`
`\ExerciseStopSelect`

`\ExerciseSelect` `\ExerciseStopSelect`

A very basic exercise selection mechanism is provided. When `\ExerciseSelect` is used, an exercise is printed if and only if the value of its keys are within the values specified after `\ExerciseSelect`. For example, the following command

```
\ExerciseSelect[type={short}, difficulty={0,1}]
```

selects the short exercises of difficulties 0 and 1, whereas

```
\ExerciseSelect[label={exe1,exe10,exe11}]
```

selects the exercises with label `exe1`, `exe10` and `exe11`. It is important to *not* have spaces before or after the commas.

With `\ExerciseStartSelect*`, the exercises which fit the conditions are *omited* instead of selected.

Last, `\ExerciseStopSelect` stops the processus of selection: every exercise will be displayed later.

The purpose of these commands is to select exercises within a long list stored on an auxiliary file.

2.4 References

If you want to make a cross-reference to an exercise, you must use the `label` key of the `Exercise` command. Afterward, you can use the usual LaTeXcommands `\ref`, `\pageref` and so on.

The `hyperref` package should work normaly, but you must load it *before* the `exercise` package.

`\refAnswer{`⟨*label*⟩`}`

`\refAnswer` Whenever an answer is connected to an exercise *via* the `ref` key, a label *Exercise label*`-Answer` is created. In this way, you can easily make reference to a given exercise.

The `\refAnswer` command is another way to reference the answer of a given exercise : its argument is the label of an exercise without the postfix `-Answer`.

In this way

```
\ref{ex1-Answer}      \refAnswer{ex1}
```

are two equivalent ways to reference the answer of the preceding exercise labeled `ex1`.

Remember that inside an `Exercise` the command `\ExerciseLabel` stores the label of the exercise. So another way to reference the exercise *inside* is own code is

```
\ref{\ExerciseLabel}
```

2.5 Extra stuff

`\marker` `\DifficultyMarker` The difficulty of an exercise is represented by a certain amount of stars. The command `\marker` is used to typeset the difficulty of an exercise.

```
\marker<symbol><counter>
```

displays `<symbol>` repeated `<counter>` times. For example `\marker*2` gives **, and `\marker+{14}` gives +++++++++++++

By default, the difficulty is symbolized by star. You can customise this by redefining the command `\DifficultyMarker`.

`\listofexercises` This command add a list of all the exercise in your document.

`\ListOfExerciseInToc`
`\ExerciseLevelInToc{`⟨*level of exercices*⟩`}`

`\ListOfExerciseInToc` `\ExerciseLevelInToc` If you prefer to display this list of exercises in the table of contents, then use the command `\ListOfExerciseInToc`.

By default, the exercises appear in the table of content at the same level as the paragraphs. The command `\ExerciseLevelInToc` is used to customize this

behaviour. For example with the command `\ExerciseLevelInToc{subsection}` the exercises will appear at the same level as the subsctions. Avalaible levels are: section, subsection, subsubsection, paragraph and subparagraph.

3 Customisation

3.1 Internationalisation

```
\ExerciseName
\ExerciseListName
\AnswerName
\AnswerListName
\ExePartName
```

`\ExerciseName` `\ExerciseListName` `\AnswerName` `\AnswerListName` `\ExePartName` `\ExePartListName`

These commands store various hard-wired string. `\ExerciseListName` is used in the `ExerciseList` environment: it is possibly an abbreviation of the word "Exercise".

Exercise.sty automatically detects the usage of babel and translate these terms in the language loaded... if I (the author) know the translation!

By now, and thanks to many contributors, english, french, spanish, italian, dutch, german, portugese and russian are supported.

If you sent me the translations in your language, I will be happy to add them in the package. Anyway, you can redefine these commands (with a `\renewcommand`).

You must load the exercise package *after* babel to activate this option.

3.2 Layout

3.2.1 Exercises, answers and parts

For the layout of the exercises, two levels of customisation are available. First, you can customise the way the informations will be typeset, and then you can customise the way these pieces of informations are typeset together.

```
\ExerciseHeaderTitle
\ExerciseHeaderDifficulty
\ExerciseHeaderOrigin
\ExerciseHeaderNB
```

`\ExerciseHeaderTitle` `\ExerciseHeaderDifficulty` `\ExerciseHeaderOrigin` `\ExerciseHeaderNB`

These commands are used to typeset the corresponding information: `\ExerciseHeaderTitle` corresponds to the `title` key, `\ExerciseHeaderDifficulty` to the `difficulty` key, `\ExerciseHeaderOrigin` to the `origin` key and `\ExerciseHeaderNB` to the number of the exercise.

In these commands, you specify the fonts to use, the space around the information, some symbols (like dash or dot) you want to put here, and so on. If the key is not present in the definition of the exercise, then the corresponding part of the header will be emptied by the package.

For example the default definition of \ExerciseHeaderTitle is

```
\newcommand{\ExerciseHeaderTitle}{\quad---\quad\ExerciseTitle}
```

If an exercise has a title, then this title will be displayed preceded by an emdash (as you can see in exercise 1 of this document). If an exercise doesn't have a title, then this command is set to nothing (precisely to {}) during the exercise.

These commands can be redefined with a \renewcommand. You don't have to worry about the "undefinition" mechanism: the package manages that by itself.

\ExerciseHeader
\ExerciseListHeader

\ExerciseHeader
\ExerciseListHeader

When the layout of all the elements has been fixed, they are collected in the \ExerciseHeader command (or in \ExerciseListHeader). Here, you specify the way the different elements are mixed together.

The default definition of \ExerciseHeader is

```
\newcommand{\ExerciseHeader}{\centerline{\textbf{\large
            \ExerciseName\ExerciseHeaderNB\ExerciseHeaderTitle
            \ExerciseHeaderOrigin\medskip}}}
```

which displays all the informations in a centered line, using a large bold default font.

\AnswerHeader
\AnswerListHeader

\AnswerHeader
\AnswerListHeader

The same mechanism is implemented for the answers. \AnswerHeader and \AnswerListHeader specifies the way the header of answers are typeset. In the definition of these commands, you can use freely the informations of the related exercise. For example, this is the default definition of \AnswerHeader:

```
\newcommand{\AnswerHeader}{\medskip\centerline{\textbf{
            Answer of \ExerciseName\ \ExerciseHeaderNB}\smallskip}}
```

\ExePartHeaderTitle
\ExePartHeaderDifficulty
\ExePartHeaderNB
\ExePartHeader
\ExePartListHeader

\ExePartHeaderTitle
\ExePartHeaderDifficulty
\ExePartHeaderNB
\ExePartHeader
\ExePartListHeader

The same kind of customisation is available for the \ExePart command: \ExePartHeaderTitle, \ExePartHeaderDifficulty and \ExePartHeaderNB control the way the title (\ExePartTitle), the difficulty (\ExePartdifficulty) and the number (\theExePart) of the part are displayed.

These pieces are collected in the command \ExePartHeader or \ExePartListHeader.

\AtBeginExercise
\AtBeginAnswer

Finally, you can use the commands `\AtBeginExercise` and `\AtBeginAnswer`. They are executed respectively at the beginning of each exercise/each answer.

For example, if you want all the answer typeset in italic shape, use

```
\newcommand{\AtBeginAnswer}{\itshape}
```

3.2.2 Questions, sub-questions and sub-sub-questions

The layout of the questions is a little more rigid. Somehow, it can be customised.

`\QuestionHeaderTitle`
`\QuestionHeaderDifficulty`
`\QuestionHeaderNB`

\QuestionHeaderTitle
\QuestionHeaderDifficulty
\QuestionHeaderNB
\subQuestionHeaderTitle
\subQuestionHeaderDifficulty
\subQuestionHeaderNB
\subsubQuestionHeaderTitle
\subsubQuestionHeaderDifficulty
\subsubQuestionHeaderNB

These commands plays the same role that the corresponding command relating to exercises. But here, no `\QuestionHeader` is defined.

The `subQuestion` and `subsubQuestion` versions of these commands are also defined.

All of these commands can be changed using `\renewcommand`.

3.3 Lengths

`\ExerciseSkipBefore`
`\ExerciseSkipAfter`
`\AnswerSkipBefore`
`\AnswerSkipAfter`

ExerciseSkipBefore
ExerciseSkipAfter
AnswerSkipBefore
AnswerSkipAfter

Before every `Exercise` environment the vertical skip `ExerciseSkipBefore` is added. The corresponding `ExerciseSkipAfter` vertical skip is added after every `Exercise` environment. `AnswerSkipBefore` and `AnswerSkipAfter` are the amount of vertical spaces inserted before an after each answer.

`\Exesep`	`\Exetopsep`	`\Exeparsep`	`\Exepartopsep`
`\Exeleftmargin`	`\Exerightmargin`	`\Exelabelwidth`	`\Exelabelsep`

Exesep
Exetopsep
Exeparsep
Exepartopsep
Exeleftmargin
Exerightmargin
Exelabelsep

These lengths have an effect only inside an `ExerciseList` environment. This environment is nothing more than a `list` environment. All the parameters of LaTeX's lists are available. Please consult your favourite source of information to have the exact definitions of these lengths.

`\QuestionBefore`	`\QuestionIndent`
`\subQuestionBefore`	`\subQuestionIndent`
`\subsubQuestionBefore`	`\subsubQuestionIndent`

QuestionBefore
QuestionIndent
subQuestionBefore
subQuestionIndent
subsubQuestionBefore
subsubQuestionIndent

Here, `\QuestionBefore` is the vertical space above `\Question`, and

`\QuestionIndent` it the horizontal distance added to the margin in question. Same thing for `\subQuestion` and `\subsubQuestion`.

3.4 The `\renewcounter` command

In a document, you will probably want to customise the way the `Exercise` counter will reseted. Strangely, it is impossible to redefined counter with LaTeX. There is no equivalent of the `\renewcommand` command for the counters.

`\renewcounter` We provide such an equivalent with the command `\renewcounter`.

`\renewcounter{`⟨*foo*⟩`}[`⟨*counter*⟩`]`

The `\renewcounter` command defines a new counter named `foo`. The counter is initialized to zero.

The optional argument `[`⟨*counter*⟩`]` causes the counter `foo` to be reset whenever the counter named in the optional argument is incremented.

If the counter `foo` was not previously defined, a LaTeX error occurs.

4 Known problems

The commands `\Question`, `\subQuestion`, etc. are heavily based on `list` environment. These lists are hidden (I know it's bad!) to simplify the syntax of the source file (I think it's nice!).

In fact, every `\Question` is like the beginning of an environment, which is closed at the next `\Question` (the exact mechanism is a little bit more complicated).

Consequently it's dangerous to put questions inside environment. The following code will lead to an error:

```
\begin{Exercise}
    \begin{multicols}{2}
        \Question ...
        \Question ...
    \end{multicols}
\end{Exercise}
```

Of course, you can put entire exercise inside other environment (like `minipage`). The following code will work:

```
\begin{multicols}{2}
    \begin{Exercise}
        \Question ...
        \Question ...
    \end{Exercise}
\end{multicols}
```

```
\EndCurrentQuestion
\EndCurrentsubQuestion
\EndCurrentsubsubQuestion
```

\EndCurrentQuestion
\EndCurrentsubQuestion
\EndCurrentsubsubQuestion

If you really need to put some questions inside environment, you must use the command `\EndCurrentQuestion` just before ending the environment. This command ends the question's "environment". So, this code will work:

```
\begin{Exercise}
    \begin{multicols}{2}
        \Question ...
        \Question ...
        \EndCurrentQuestion
    \end{multicols}
\end{Exercise}
```

In `ExerciseList` environment, the command `\Exercise` shouldn't be followed by an empty line.

5 Implementation

5.1 Package options

This part deals with the package options. Nothing more than an affair of boolean.

```
\newif\if@AnswerOutput        \@AnswerOutputtrue
\newif\if@AnswerDelay         \@AnswerDelayfalse
\newif\if@ExerciseOutput      \@ExerciseOutputtrue
\newif\if@ExerciseDelay       \@ExerciseDelayfalse
\newif\if@AswLastExe          \@AswLastExefalse

\DeclareOption{noanswer}     {\@AnswerOutputfalse}
\DeclareOption{answeronly}   {\@AnswerOutputtrue\@ExerciseOutputfalse}
\DeclareOption{noexercise}   {\@ExerciseOutputfalse}
\DeclareOption{exerciseonly} {\@AnswerOutputfalse}
\DeclareOption{outputnothing}{\@ExerciseOutputfalse\@AnswerOutputfalse}
\DeclareOption{exercisedelayed}{\@ExerciseDelaytrue}
\DeclareOption{answerdelayed}{\@AnswerDelaytrue}
\DeclareOption{lastexercise} {\@AswLastExetrue}
```

The following option, which displays the exercise label in margin, is not implemented yet.

```
\newif\if@ShowLabel              \@ShowLabelfalse
\DeclareOption{showlabel}       {\@ShowLabeltrue}

\ProcessOptions
```

The only required package are keyval and ifthen.

```
\RequirePackage{keyval, ifthen}
```

\newcommand{\@decalemathindent}[1]{\relax}
\newcommand{\@restoremathindent}{\relax}
\if@fleqn %
  \renewcommand{\@savemathindent}{\setlength{\@savedmathindent}{\mathindent}}
  \renewcommand{\@decalemathindent}[1]{\addtolength{\mathindent}{#1}}
  \renewcommand{\@restoremathindent}{\setlength{\mathindent}{\@savedmathindent}}
\else
  \renewcommand{\@savemathindent}{\relax}
  \renewcommand{\@decalemathindent}[1]{\relax}
  \renewcommand{\@restoremathindent}{\relax}
\fi
```

5.4 The \renewcounter command

This commands is the equivalent of the well–known `\renewcommand`, but for counter. It allows you to redefine the `Exercise` counter, in order to reset it at each chapter (for example).

```
\def\renewcounter#1{%
    \@ifundefined{c@#1}
    {\@latex@error{counter #1 undefined}\@ehc}%
    \relax
    \let\@ifdefinable\@rc@ifdefinable
    \@ifnextchar[{\@newctr{#1}}{}}

\def\ext@exercise{loe}
\newcommand{\ExerciseLevelInToc}[1]{\def\toc@exercise{#1}}
\ExerciseLevelInToc{exercise}
\newcommand{\ListOfExerciseInToc}{\def\ext@exercise{toc}\ExerciseLevelInToc{paragraph}}
\newcommand\listofexercises{%
    \section*{\listexercisename}%
    \@mkboth{\MakeUppercase\listexercisename}%
    {\MakeUppercase\listexercisename}%
    \@starttoc{\ext@exercise}%
}
\newcommand*\l@exercise{\@dottedtocline{2}{1.5em}{2.3em}}
```

Index

For entries in type-writer font, numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the definition; numbers in roman refer to the pages where the entry is used.
